The invention relates to determining genetic merit of a bovine with respect to milk composition and volume and involves determining the GHR crespect to milk composition and volume and involves determining the GHR growth hormone receptor) genotypic state of the bovine. The genotypic state is determined by the presence of at least one nucleotide difference from the nucleotide sequence, genomic and cDNA encompassing the bovine GHR gene selected from AD103978-AD103981, or by the presence of one or CH-G), Nt 931+21 (A-G), Nt 1922 (C-T), Nt 1055 (C-T), Nt 1635 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Determining genetic merit of a bovine with respect to milk composition and volume comprises determining the GHR genotypic state of the bovine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cornet A, Berzi P;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method of diagnosing the presence of, or susceptibility to, retinal dystrophy, cardiomyopathy, endocrinopathy, cardiomyopathy, endocrinopathy, cardiomyopathy in a sample from the individual. The method comprises cyping in a sample from the individual the ALMS1 protein or ALMS1 gene region of the individual, or detecting aberrant ALMS1 activity. Human Cardion, endocrinopathy antidabetic, hepatocropic and nephrotropic activities, and can be used in gene therapy. The method is useful for activities, and can be used in gene therapy. The method is useful for cardiomyopathy, endocrinopathy (e.g. liver disease or renal impairment), cardiomyopathy, endocrinopathy (e.g. liver disease or renal impairment), cardiomyopathy, endocrinopathy or diabetes is useful in manufacturing a cardiomyopathy, endocrinopathy or diabetes is useful in manufacturing a cardiomyopathy, endocrinopathy or diabetes is useful in manufacturing a cardiomyopathy, endocrinopathy or diabetes is useful in manufacturing a cardiomyopathy, endocrinopathy or diabetes as useful in manufacturing a cardiomyopathy cretinal dystrophy, cardiomyopathy, endocrinopathy or diabetes.                                                                                                                                                                                                                          The present invention relates to human nucleic acid sequences (I, ADO15739-ADO15912) obtained from 4 synthesis-period (stage 4S) of neuroblastoma cell. (I) is useful for prognosing and determining th progress stage of 4 synthesis-period of neuroblastoma. The present sequence is a primer, used to illustrate the invention.

This sequence represents a PCR primer for a S. aureus polynucleotide of the invention. The invention also relates to the polypeptides encoded by the S. aureus polynucleotides. The polypeptides can be used for the treatment or prevention of disease. The polypeptide or polynucleotide can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S. aureus infection; diagnosis; therapy; central nervous system disorder; upper respiratory tract infection; otitis media; bacterial tracheitis; acute epiglottitis; thyroiditis; empyema; lung abscess; splanta bascess; cardiac infection; infective endocarditis; secretory diarrhoea; ulcer; retroperitoneal abscess; cerbral abscess; blepharitis; conjunctivitis; karaitis; endophthalmitis; preseptal cellulitis; orbital cellulitis; toxic shock syndrome; impetigo; follululitis; cutaneous abscess; toxic shock syndrome; impetigo; folliculitis; cutaneous abscess; cellulitis; wound infection; bacterial myositis; septic arthritis; one construction; contemplatorer; gastritis;
                                                                                                                                                               is useful
                                                                The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06733 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01315-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaccutical agents. The present sequence represents an oligonucleotide used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

calso be used to diagnose diseases related to their expression. The polypeptides and vectors containing them can also be used in immunisation polypeptides and vectors containing them can also be used in immunisation methods. The products can be used for treating infection, e.g. infections of the upper respiratory tractifies, bacterial tracheitis, contemporations, contemporations, contemporations, caute epiglottitis, thyroiditis), respiratory (e.g. empyema, lung abscess), cardiac (e.g. infective endocarditis), gastrointestinal (e.g. conjunctivitis, keratitis, endophthalmitis, preseptal and orbital conjunctivitis, keratitis, endophthalmitis, preseptal and orbital collulitis, darryooystitis), kidney and urinary tract (e.g. blepharitis, epididymitis, intrarenal and perinaphric abscess, toxic shock syndrome), skin (e.g. impetigo, folliculitis, cutaneous abscesses, cellulitis, wound infection, bacterial myositis), bone and joint (e.g. septic arthritis, cancer, ulcers and gastritis). The products can also be used for treating in-dwelling devices and wounds
                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is a PCR primer used in the cloning of the T66Bk gene. The invention related to a nucleic acid molecule (I) comprising a transcription unit encoding in its 5' portion a kinase having a homology to MARK2 kinase and the 3' portion of the nucleotide sequence has a high homology to rsk3 kinase. Sperm produced by transgenic creatures containing (I) are useful for production of offspring. T66Bk, its regulatory region, recombinant DNA, vectors, host cells, antibodies, etc., are useful for the isolation of receptors on the surface of sperm recognising attractants of the egg cell for the development and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Transcription unit; MARK2 kinase; rsk3 kinase; regulatory region; T66Bk; contraceptive; Responder/Distorter signalling cascade; t-Responder;

production of contraceptives. They can also be used to identify chemicals or biological compounds able to trigger the (premature) activation or inhibition of the Responder/Distorter signalling cascade, or to identify and isloate receptors and other members of the cascade that bind the expression products. The methods for detecting the sperm of the cransgenic animal, and selecting against (I) also provide a means for transgenic animal, and selecting against (I) also provide a means for the remainsain artio of genetic traits by altering genes of the Responder/Distorter signal cascade other than the t-Responder. They calso allow distortion, to a non-Mendelian ratio, of the transmission of a sneetic trait, i.e. determination of sax, from male mammals to their of genetic trait, i.e. determination of sax, from male mammals to their coffspring by expressing during spermatogenesis/spermiogenesis a gene involved in sperm motility and/or fertilisation. The genes and proteins involved in the responder phenotype and Responder/Distorter signalling cascade, as well as the inventive methods are advantageous in breeding strategies by allowing for specific selection of genetic traits and in the protein of sex

                                                                                                                        The present invention describes compounds of 8-30 nucleobases antisense to a nucleic acid encoding human or mouse tumour necrosis factor receptor 2 (TNFR2). Also described is a method for inhibiting expression of human or mouse TNR2 comprising contacting cells or tissues in vitro with one of the claimed compounds. The antisense compounds are used to treat a disease or condition associated with expression of TNFR2. The present sequence represents a human TNFR2 antisense chimeric phosphorothioate oligonucleotide, which is given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or masal airway dysfunction and a second active agent comprising an antifilammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antisathmatic; Pypotensive; immunosuppressive; cycostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of udequinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; antisense; bronchoconstriction, allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic, antiinflammatory; antiashmatic; analgesic; hypotensive; immunosuppressive; cycostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory districtions and respiratory districtive beta-adrenergic obstructive pulmonary disease; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     comprising oligonuclectides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel composition (a) a first active agent
                                                                                                                                                                                                                                                                                                                                                   Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ç
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted nucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ä

expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligomucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to composition comprises oligo and is administered to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lungs or seduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies add/or bronchoconstriction are associated inflammation, allergies asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system center any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20 BP; 4 A; 2 C; 7 G; 7 T; 0 U; 0 Other;

New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

Claim 4; SEQ ID NO 4545; 417pp; English.

```
ö
             nucleic acid molecule encoding Navi.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navi.3. The compound and composition are useful for treating a disease or condition associated with Navi.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate olisonucleotide with 2, MOB wings and a deoxy gap. Used during the antisense inhibition of human Navi.3 expression, the oligonucleotides are designed to target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleic acid molecule encoding Navi.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navi.3. The compound and composition are useful for treating a disease or condition associated with Navi.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense compound targeted to a nucleic acid molecule encoding May1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; 8s.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligomicleotide with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound targeted to a nucleic acid molecule encoding abav1.3, usful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, selzure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.
                                                                                                                                                                                                                                Gaps
sequence represents a chimeric phosphorothioate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.

The invention relates to a method of treating a neurodegenerative disorder comprises administering to an individual cells capable of exogenously regulatable neurotransmitter synthesis. Treating a neurodegenerative disorder comprises administering to an individual cells capable of exogenously regulatable neurotransmitter synthesis and periodically exposing the individual to an agent or condition capable of regulating the synthesis of the neurotransmitter in the cells. The method and cells are useful in treating a neurodegenerative disorder e.g. multiple sclerosis, amyotrophic lateral sclerosis, autoimmune encephalomyplitis, Alzheimer's disease, or Huntington's disease, preferably Parkinson's disease. The present sequence represents a human CD90 reverse transcription (RT)-PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exogenously regulatable neurotransmitter synthesis; multiple sclerosis; amyotrophic lateral sclerosis; autoimmune encephalomyelitis; Alzheimer's disease; Huntington's disease; Parkinson's disease; human; reverse transcription; RT-PCR; primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating a neurodegenerative disorder, e.g. multiple sclerosis, or

The invention comprises the amino acid and coding sequences of novel human proteins - designated NoVX proteins (e.g. NoV1). The NoVX DNA and protein sequences are useful for treating or preventing NOVX-associated disorders, such as: diabetes; obesity; infectious disease; anorexia; neurodegenerative disorders; Alzeimer's disease; Parkinson's disease; immune disorders; haematopoietic disorders; dyslipidaemias; metabolic syndrome X; wasting disorders; cancer; Chron's disease; cirrhosis; liver failure; infertility; cardiomyopathy; atherosclerosis; hypertension; scleroderma; haemophilia; pancreatitis; asthma; pain; psoriasis; and epilepsy. The NoVX DNA sequences of the invention are useful in screening assays and detection assays (e.g. chromosomal mapping, tissue typing and forensic biology). The NoVX DNA sequences can also be used to create a transpend animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated human polypeptide, designated NOVX, useful for treating or preventing cancer, diabetes, obesity, dyslipidemia, anorexia, and metabolic, neurodegenerative, immune and hematopoietic disorders.
                            diabetes; obesity; infectious disease; neurodegenerative disorder; ss; anorexia; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyslipidaemias; metabolic syndrome X; cancer; wasting disorder; Chron's disease; cirrhosis; liver failure; infertility; cardiomyopathy; atherosclerosis; hypertension; scleroderma; haemophilia; pancreatitis; asthma; pain; psoriasis; epilepsy; chromosomal mapping; tissue typing; forensic blology; transgenic animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Furtak K, Perna A, Patturajan M, Shimkets RA, Guo X;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA sequences AAH62100 - AAH62688 represent segments of human genes which contain single nuclectide polymorphisms (SNPs). A method is included in the invention for analysing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites of the SNP containing sequences. The nucleotide sequences can be used in the diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in applications such as pharmaceutical such as pharmaceutical in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical such as pharmaceutical.
                                                                                                              Proteasome 26S subunit ATPase polymorphism containing DNA fragment #341.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid segments of the human genome, particularly from genes including polymorphic sites, for phenotype correlation, forensics, paternity testing, medicine and genetic analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Revised record issued on 09-SEP-2004 ; Correction to Feature Table Key

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is cused for preventing the development of cancer. The inhibitor is precancerous condition, by administering to the patient having a present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms of the gene correct is active on at least one but less than all allelic forms of the gene commal somatic cells, and the first gene. The products and methods can be cancers, atheroselerotic plaques, premalignant metaplastic or dysplastic cancers, atheroselerotic plaques, premalignant metaplastic or dysplassic cancers, and the disease. The method can also be used to remove allowed the state of the maintain cells from bone matrow transplants. AMZSS812-Z26825 represent human and the cancers of the invantion the cancers of the cancer of
                                                                                                                                                                                           ö
in the sera of HIV-infected individuals. IFN-alpha-5 was the dominant IFN species present. (Updated on 25-MAR-2003 to correct FN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polymorphism; human; inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atheroselerotic plaque; premalignant metaplastic lesion; endometriosis; dysplastic lesion; benign tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.

The antagonist is selected from a mutein of natural CTACK or Vic. an antibody which neutralises CTACK or Vic or an antibody which block GPR2 ligand binding. The CTACK or Vic agonists or antagonists are useful for treating medical conditions or diseases associated with immunological conditions of the skin. Two primers (AAA47554, AAA47555) were used to amplify a human CTACK fragment for use in competitive RT-PCR

This sequence represents a primer which was used in quantitative analysis of protein expression in pro-B cells of human origin that are deficient in functional Pax5 expression. The autologous human Pax5-deficient pro-B cells or pax5-deficient pro-B cells derived from a HLA-matched donor are useful in treating immunodeficiencies or AIDS. Pax5-deficient pro-B cells gystem, including immunodeficiencies or AIDS. Pax5-deficient pro-B cells derived from an HLA-matched donor are also useful in non-myeloablative tumour therapy. The expression of the Pax5 can in inactivated by means of antisense RNA, small interfering RNA or a criboxyme. In inactivating the expression of the Pax5 gene is inactivating the expression of the Pax5 gene, an expression casette encoding one or more pax5-inhibiting oligonucleotide molecules in inserted into lentiviral vector. The lentiviral vector is transfected into specialized packaging cells to generate pseudotyped lentiviruses the pro-B cells obtained are infected with the pseudotyped lentivirus and cultured. Other functions of the Pax5-deficient pro-B cells are either

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  a mammal that is modulated by administering to a mammal an antagonist of TTACK, an agonist of CTACK, an antagonist of Vic. or an agonist of CTACK, an antagonist of Vic. The methods are useful for modulating movement of a cell within or to the skin of a mammal, purifying a populating of cells, producing a ligand: receptor complex, modulating physiology or development of a GPR2 receptor ligand interaction, and for treating a patient suffering from a skin disorder such as psoriasis, skin cancer, carcinoma, inflammation, allergies, contact dermatitis, allergic dermatitis, wound healing and infections (including microbial, viral and parasitic) comprising administering an antagonist against GPR2, vic or CTACK. The invention regulates the development or physiology of relevant cells. The present sequence represents the human cutanoous-T-cell-attracting chemokine CTACK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modulating movement of cell within or to the akin of mammal useful for treating a skin disorder comprises administering an antagonist/agonist of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to novel compositions that comprise short interfering RNA (siRNA) molecules, which can be used to inhibit angiogenesis. Specifically, it refers to siRNAs that target and cause RNA-induced degradation of mRNA from human vascular endothelial growth cator (VEGP), the VEGF receptor (FiL-1) and the FIR-1/KDR (kinase domain region) genes, as well as mutants derived thereof. The present invention describes sense and antisense RNA strends that form an RNA duplex and bind to the target mRNA, such that expression is inhibited and the target bind to the target mRNA, such that expression is inhibited and the target degraded. As such, siRNA administered in combination with a therapeutic degraded. As such, recating diseases associated with angiogenesis and related macular degeneration, inflammatory disease, psoriasis and related macular degeneration, inflammatory disease, psoriasis and related macular degeneration, inflammatory disease, psoriasis and relating breast, retinoblastoma, Wilm's tumour and lymphoma. Accordingly, these compositions exhibit cytostatic, antidiabetic, and ophthalmological, antinflammatory, antipsoriatic, antidiabetic, and ophthalmological, antinflammatory, antipsoriatic, antidiabetic and compositions main and an antiantial and an antiantial and and an antiantiantial and an antiantial and and an antiantial and and an antiantiantial and an antiantiantial and and an antiantial and an antiantiantial and an antiantial and an antiantial and an antiantiantiant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

This invention relates to novel compositions that comprise short confered interfering RNA (siRNA) molecules, which can be used to inhibit and operates and specifically, it refers to siRNAs that target and cause anajogenesis. Specifically, it refers to siRNAs that target and cause RNAi-induced degradation of mRNA from human vascular endothelial growth rector (VRGF), the VEGF receptor (Fit-1) and the Fik-I/KDR (kinase domain cargino) genes, as well as mutants derived thereof. The present invention describes sense and antisense RNA strands that form an RNA duplex and certibes sense and antisense RNA strands that form an RNA duplex and cegraded. As such, siRNA administered in combination with a therapeutic degraded. As such, siRNA administered in combination with a therapeutic capent is useful for treating diseases associated with anglogenesis and the overexpression of VEGF, which include diabetic retinopathy, agence anacular degeneration, inflammatory disease, psoriasis and cancers including breast, retinoblastoms, wilm's tumour and lymphoma. Concers including breast, retinoblastoms, wilm's tumour and lymphoma. Concers including breast, retinoblastoms, wilm's tumour and lymphoma. Concers including the attinilammetory, antipsoriatic, antithemmatic and contactivities cativities. This oligonucleotide is a human Flt-1 DNA coligo, a target for sirNA inhibition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NGGO; hammerhead ribozyme; DNAzyme; inozyme; G-claaver; amberzyme; zinzyme; lymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; MHL; lymphocytic leukaemia; human immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel short interfering RNA (siRNA) comprises sense and antisense RNA strands, useful for inhibiting expression of human vascular endothelial growth factor mRNA, for treating angiogenic disease, e.g. diabetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule or consisting RNA with an NCH motif), a Zinzyme (cleaving RNA with an NCH motif), a Calcaver (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with an NGN triplet), a secontacted with a cell to reduce CD20 activity of the cord contacted with a cell to reduce CD20 activity of the cord CD20. The treatment may further comprise the use of one or more creat lymphoma, leukaemia, B-call lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-call lymphocytic lymphoma, immunocytoma (IMC), small B-call lymphocytic lymphoma, immunocytoma (IMC), small B-call lymphocytic lymphoma, creatence of a divalent cation that is preferably MG2/4. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the craspence of a divalent cation that is preferably MG2/4. Furthermore, the NOGO-the treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more cell and treat a patient (NGS) injury and cerebrovascular accident (CCVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (RNS), chemotherapy-induced neuropathy, anyworrophic acceptance of a divalent and may further compare and ensymbole and m
inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; Parkinson's disease; ataxia; Huntington's disease; Creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NOGO expression. ```
The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence has 15 consecutive nucleotides of these nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides, rhe nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversibion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies (A) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides and polypeptides can and/or prognosis of these diseases. The nucleotides and polypeptides can and/or prognosis of these diseases. The nucleotides and polypeptides can be used to screen for their specific interactive molecules,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.

```
The invention relates to the isolation of 6327 nucleotide sequences, cfragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides. The nucleotides are used as probes or primers for detecting, cfrom antisense sequences, of nucleotides involved in tumour sepse and antisense sequences, of nucleotides involved in tumour csuppression or reversion, apoptosis and or viral resistence, to produce suppression or reversion, apoptosis and or viral resistence, to produce crecombinant polypeptides, and to prepare transgenic animals, as recombinant polypeptides (also vectors containing them and cypreptides (also vectors containing them and cols containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours or also be used to screen for their specific interactive molecules, and/or progness of these diseases. The nucleotides and solypeptides can also be used to screen for their specific interactive molecules, containing the used to these diseases. The nucleotides and polypeptides can be pretailed with abnormal

                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a probe used in an example from the present invention. The present invention describes an analytical solid phase method for detecting nucleic acids. The method comprises obtaining a base sequence which hybridises with the polynucleotide sequence of the target, and a set of probes immobilised on the solid phase via a linker which is enzymatically ligated during hybridisation. The product is used for the detection of specific nucleic acids. Possible fields of sepplication include diagenosis of disease, detection of drug sensitivity, screening for appropriate transplantation organs, testing in the food industry to prevent food poisoning. A simple, quick method for selectively detecting target in a mixed sample is obtained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                5'-phosphorylated and 3'-biotinylated probe (Seq ID No: 5 of WO9935287).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Two-probe system; nucleic acid detection; hybridisation; immobilisation; phosphorylation; diagnosis; infectious disease; drug receptor; toxin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the important describes a consistent of two probes are which hybridise to adjacent sections of the target polynucleotides are which hybridise to adjacent sections of the target polynucleotide. These are immobilised by their 5' and 3' ends respectively to a solid phase and the free end of one is phosphorylated. One probe is labeled and is connected to the solid phase via a breakable section. The test sample is introduced and after hybridisation to the target polynucleotide sequence (if present) a ligase is added to join the non-immobilised ends of the probes. The target polynucleotide chain is removed, and the breakable section split. If the target sequence was present, the labeled probe remains immobilised to the solid phase because of ligation to the other probe, but if the target sequence was not present it is released. Detection of the label on the solid phase shows that the target sequence was present in the rest sample. The method is used for the detection of specific nucleotide sequences in applications such as the diagnosis of infectious and other diseases, the detection of drug receptors, in foodstuffs. The method is of high sensitivity and high specificity, and is able to discriminate the target sequence from sequences containing a single base mismatch. Sequences AAX83309-327 represent probes and

The present invention relates to a method and apparatus for transgenic and targeted mutagenesis screening of genomic DNA. The method comprises depositing genomic DNA on a substrate, adding at least one labelled probe specific for a portion of the genomic DNA, and detecting the signal from the probe. The invention also provides a system for screening DNA for a designated genetic sequence, the system includes a computer having a processor, memory web browser and an automatic screening device that analyses samples of genomic DNA for the designated sequence. The method is useful for detecting a designated genetic sequence. The method is useful for detecting a designated genetic sequence in a sample of genomic DNA. The method is useful for tapid identification of an organism, whose genome possesses specific genetic sequences that exist endogenously or has been modified, mutated or genetically engineered. The method is more accurate, faster and is a high volume transgenic and targeted mutagenesis screening method. The screening results are provided to a researcher more quickly than by the prior art methods. The present sequence for Streptomyces hygroscopicus hygromycin probe is used in the
                                                                                                                                                                                                                                                                                                                              Detecting designated genetic sequence in genomic DNA sample, comprises depositing genomic DNA on substrate, adding labeled probe specific for portion of DNA and detecting signal from labeled probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gape

The invention relates to diagnosing a predisposition to fat deposition or leanness in a subject comprising detecting the presence or absence of a polymorphic variation associated with fat deposition at a polymorphic site in a PLAZGIB nucleotide sequence in a nucleic acid sample from a subject, where the presence of the polymorphic variation is a guanne at position 7128 or thymine at position 9182 of the present sequence. The method is useful for diagnoshig a predisposition to fat deposition or learness in a subject, and consequently for diagnoshig a predisposition to non-insulin dependent diabetes mellitus (NIDDM) in a subject and conditions such as hypertension, glucose intolerance, dyslipidemia, hypertension, glucose intolerance, dyslipidemia, hypertension, glucose intolerance, dyslipidemia, hypertension of preventive measures. Sequences ADI35084-ADI35103 represent PCR primers used in assays for verifying and genotyping single nucleotide polymorphism (SNP)s in a human PLAZGIB nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human; PCR; ss; fat reduction; fat deposition; phospholipase A2; PLA2GlB; appetite suppressant; lipase inhibitor; exercise regimen; obesity; non-insulin dependent diabetes mellitus; NIDDM; cardiovascular disorder; hypertension; antidiabetic; primer.
                                                                                                            Diagnosing a predisposition to fat deposition or leanness, useful for diagnosing a predisposition to e.g. diabetes or hypertension, comprises detecting the presence of a polymorphism in the PLA2GIB nucleic acid from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying a candidate therapeutic for fat reduction, useful for treating diabetes, by introducing a test molecule to a system comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PCR primer 8 to genotype SNPs of human phopholipase A2 (PLA2G1B) DNA.

This invention relates to a novel candidate therapeutic agent useful for far teduction and disorders related to fat depositions. Specifically, it refers to polymorphic variations in the phospholipase A2 (PLAZGIB) DNA, which is located on chromosome 1224 and has been associated with central cf at deposition. The present invention describes methods to detect the presence or absence of these single nucleotide polymorphisms of PLAZGIB, comparessant, an articular G7328A and T918A2G, and subsequently provide treatment that reduces fat deposition. This treatment may consist of an appetite reduces fat deposition. This treatment may consist of an appetite comparessant, a lipase inhibitor, a phospholipase inhibitor, an exercise compared to a paychotherapy or a reducent and actual paychological counselling, psychotherapy or a cyclotherapeutic. Accordingly, PLAGGIB is a target for reducing fat deposition and it can be used to treat both obesity and non-insulin deposition and it can be used to treat both obesity and non-insulin condeposition and it can be used to exhibite antidiabetic activity. This colliponucleotide sequence is a PCR primer used to amplify a region of interest (i.e. genotype SNPS) in human PLAZGIB DNA of the invention. Human, matrix metalloproteinase 11, MMP11; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-0-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; cytostatic. New oligonucleotide compound that inhibits expression of matrix metalloproteinase 11, useful for preparing a composition for treating hyperproliferative disorder, e.g., cancer. Gaps Human matrix metalloproteinase 11 DNA antisense oligonucleotide #27. PLA2G1B protein or nucleic acid, and determining the presence of interaction between the compounds. .. 0.3%; Score 16; DB 1; Length 20; 100.0%; Pred. The superfamily of kinesins function as molecular engines to bind and transport vesicles
oligonucleotide comprises at least one modified internucleoside linkage 1.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylycytosine. The antiseense compounds are useful for modulating the expression of the MMP11 polypeptide and in preparation of a composition for treating hyperpoilferative disorders, e.g. cancer. This sequence represents an antisense oligonucleotide targeted to DNA encoding the human MMP11 polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                               Antisense; kinesin-like 1; N2 kinesin; bimC kinesin; cellular proliferation; cancer; B-cell leukaemia; autoimmune disease; carpal tunnel syndrome; Raynaud's phenomenon; systemic sclerosis; Sjorgren's syndrome; rheumatoid arthritis; polymyositis; polyarteritis; systemic lupus erythematosus; mouse; se; human.

and organelles along microtubules using energy supplied by ATP. Kinesin-
like 1, a member of the N2 (also called bimC) family of kinesins, is
involved in separating the chromosomes by directing their movement along
microtubules in the bipolar spindle. Kinesin-like 1 is also known as
KNSL1, Eg5, HaEg5, HKSP, KIFI1, thyroid interacting protein 5 and TRIP5.
CC Inhibition of kinesin-like 1 may be a target for arresting callular
CD proliferation in cancer, due to its central role in mitosis. Expression
of kinesin-like 1 expression may contribute to other disease states such
CC arthritis, polymyositis and polyarteritis. Kinesin-like 1 is an
CC arthritis, polymyositis and polyarteritis. Kinesin-like 1 is an
CC arthritis, polymyositis and polyarteritis. Kinesin-like 1 is an
CC autcantigen identified in systemic lupus erythematosus. The invention
CC autcantigen identified in systemic lupus erythematosus. The invention
CC autcantigen identified in systemic lupus erythematosus. The invention
CC composition of kinesin-like 1. Also provided are methods of screening for
CC modulators of kinesin-like 1 and to methods of modulating the expression
CC finesin-like 1. At least a portion of the compound hybridises with RNA
CC form an oligonucleotide-RNA duplex. It has at least one
CC comprise an antisense nucleic acid molecule that is specifically
CC hybridisable with a 5-untranslated region (UTR), with a start region,
CM that a coding region, with a 3-UTR, with an intron-
CC comprise an uncleic acid molecule encoding kinesin-like 1.
CC changes where synthesised via solid phase PUIII) phosphorable of chamistry.
CC chamistry, man arrivered to moule of an uncleic acid molecule encoding kinesin-like 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligonucleotides were synthesised via solid phase P(III) phosphoramidite chemistry. The present sequence is an antisense oligo targeted to mouse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Endothelial monocyte acitivating peptide; EMAP-II; antagoniat; antibody;

in the specification. In particular, the method can be used in the diagnosis of atherosclescosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to disease. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         is from exon 5 and contains a mutation which causes a nonsense codon at position 151 (AAV22622 is the normal wild type sequence). Adhalin belongs to the sarcolemmal complex of dystrophin-associated proteins. Mutations in the adhalin protein are one of the causes of muscular dystrophy. A new method for the detection of a mutation in the human adhalin gene, comprises incubating a sample with a nucleic acid probe (e.g. present sequence). The probe specifically hybridises to the mutant form of the gene but not the wild type. Any specific hybridisation is then detected. The method is useful for detecting mutations in the human adhalin gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Genetic detection of primary adhalinopathies - using nucleic acid probes which bind to mutant adhalin genes but not the wild type gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a fragment of the human adhalin gene.                                                                                                                                                                                                                                                                                                                    유
                                                                                                                                                                                                                                     ö
                             A new method for facilitating vascular growth is described which comprises inhibiting endothelial monocyte activating polypeptide (EMAP) II by down-regulating EMAP II expression, or by using EMAP II receptor antagonists or compounds that specifically bind to EMAP II e.g. antibodies. The method is useful treating patients at risk for ischaemic reperfusion injury to the lungs and newborn babies affected with bronchopulmonary dysplasia (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polyworphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention considerable and application of the invention studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents methods, as well as the characterisation of the pharmaceutical efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of HIV gene by RNA interference. The siNAs may or may not comprise riboncleotides and may be double or single stranded.

They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide.

Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a coxtrain vitro or in vivo delivery of siNA; conjugates and/or complaxes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the HIV gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. HIV siNAs and we the treatment of a variety of conditions. HIV and may be used to treat HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New double-stranded short interfering nucleic acid, useful for treating infection with human immune deficiency virus, comprises sugar-modified

```

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of HIV gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are
                                                                                                                                                               ö

infection. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of HIV-targeted double-stranded siNA, which is identical

assembled from a sense oligonucleotide and an antisense oligonucleotide.

Specifically, the siNAs include short interfering RNA (siRNA), double-
c stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs

can be unmodified or chemically modified, can contain

cc deoxyribonucleotides, and can be chemically synthesised, expressed from a

cc vector or enzymatically synthesised. The invention also relates to kits

cvetor or enzymatically synthesised. The invention also relates to kits

cc for the in vitro or in vivo delivery of siNA, conjugates and/or complexes

cc fsiNA; and vectors that express siNA. The siNAs are used to modulate

cc expression of the HIV gene in cells, tissue explants or organisms (e.g.,

cc avicety of conditions. HIV siNAs have anti-HIV activity. They may be

cc antiety of conditions. HIV siNAs have anti-HIV activity. They may be

cc infection. The siNAs are also useful for drug screening, diagnosis,

therapeutic target identification and validation, genetic engineering,

cc pharmacogenomics, studying gene function, and gene mapping (e.g., of

single nucleotide polymorphisms). The present sequence represents the

cc lower strand of an HIV-targeted double-stranded sinA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA, double-stranded RNA; micro-RNA, miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; cancer; cytoetatic; human; oncogene; epidermal growth factor receptor; EGFR; HER2; EGFR2; neu; erbB2; c-erb-B-2; ss.

downregulate expression of one or more human epidermal growth factor

converged to the sinal standard. HER2 HER3 and HER4) by RNA

interference. The sinas may or may not comprise sense and antisense

crectors, or alternatively are assembled from a sense oligonucleotide and

an antisense oligonucleotide. Specifically, the sinas include short

interfering RNA (skRNA), double-stranded RNA, micro-RNA (miRNA) and short

hairpin RNA (shRNA). The sinas can be unmodified or chemically synthesised,

can contain deoxyribonucleotides, and can be chemically synthesised,

expressed from a vector or enzymatically synthesised. The invention also

relates to kits for the in vitro or in vivo delivery of sina, conjugates

and/or complaxes of sinA; and vectore that express sinA. The sinas are

used to modulate expression of EGFR genes in cells, tissue explants or

organisms (e.g., by ex vivo gene therapy), or in grafts and transplants

corganisms (e.g., by ex vivo gene therapy), or in grafts and transplants

corganisms (e.g., by ex vivo gene therapy), or in grafts and transplants

treating a wide range of cancers such as breast and ovarian cancer. The

sinas are also useful for drug screening, diagnosis, therapeutic target

identification and validation, genetic engineering, pharmacogenomics,

cludying gene function, and gene mapping (e.g., of single nucleotide

polymorphisms). The present sequence represents the lower strand of a

HER2 (EGFR2)-targeted double-stranded sinA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human HER2 (EGFR2) transcript target sequence/sinA upper strand, SEQ:247
                    New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of the epidermal growth

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of one or more human epidermal growth factor ceceptor (EGFR) genes (including HER1, HER2 and HER3 and HER4) by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense cregions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (shRNA), the siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also expressed from a vector or enzymatically synthesised. The invention also cand/or complexes of siNA; and vectors that express siNA. The siNAs are cused to modulate expression of EGFR genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants or creating a wide range of cancers such as breast and ovarian cancer. The treatment of a variety of conditions. They may be used for treating a wide range of cancers such as breast and ovarian cancer. The sinAs are also useful for drug screening, diagnosis, therapeutic target condition, and gene mapping (e.g., of single nucleotide condition, the upper strand of a chancer and outper strand of a chancer in a double-stranded sinA, which is identical to the upper strand of a chancer in a double-stranded sinA, which is identical to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                coronary artery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; glucose—metabolism-related disorder; dabetes; cancer; breast cancer; colon cancer; lung cancer; neurological disease; Huntington disease; spinocerebellar ataxia; viral disease; AIDS; apolipoprotein B; apoB; ss.

The invention describes a kNA interference (ikMa) agent (1) compilabing a gense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2 -0 alkyl modifications, the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (1); reducing (M1) apoB-100 are: a pharmaceutical preparation comprising (1); reducing (M1) apoB-100 care: a pharmaceutical preparation comprising (1); reducing (M1) apoB-100 evels or glucose-6-phosphatase levels in a subject; producing (I); controlled a sequence with activity and introducing one or more asymmetrical modification in the sequence, where controlled in the comprising (1) and instruction for its use; and a device activity; a kit comprising (1) and instruction for its use; and a device controlled for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M2) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M3) cotherwise unwanted expression of apoB-100, elevated or otherwise unwanted controlled in a disorder characterised by elevated or cherwise unwanted expression of apoB-100, elevated or otherwise unwanted cyclosersholestrolledmia, statin-resistant controlledmia, proceeding statin-resistant controlledmia, statin-resistant controlledmia, coronary attery disease (CAD), coronary heart of disease (CMD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating the diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned above, cancer (e.g. breast, colon or treating the disease (e.g., funtington disease or cancer (e.g., breast, colon or treating the disease (e.g., funtington disease or expression.

C spinocerbellar ataxia) or viral disease (e.g., funtington disease (e.g., funtington disease (e.g., funtington disease (e.g., funtington dise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              invention describes a RNA interference (iRNA) agent (I) comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 19 BP; 3 A; 6 C; 1 G; 9 T; 0 U; 0 Other;

```
The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequence saymetrical bhosphorothioate modifications sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (I); stabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                       cytostatic; anticonvulsant; noctropic; musculas; anti-HIV, RNA interference; iRNA; antisense technology; lipid metabolism; cholesterol imbalance; dyslipidaemia hypercholesterolaemia; coronary artery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; glucose-metabolism-related disorder; diabetes; cancer; breast cancer; spinocene; lung cancer; neurological disease; Huntington disease; spinocerebellar ataxia; viral disease; AIDS; apolipoprotein B; apoB; ss.
                                                                                                                                                                       antilipemic; cardiant; vasotropic; antiarteriosclerotic; antidiabetic;
                                                                                                                                      Human apolipoprotein B (ApoB) oligonucleotide seqid 4960.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 5; SEQ ID NO 4960; 378pp; English.

is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted levels of cholesterol, and/or disregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholesterolasterol imbalance, dyslipidaemias, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or virence production or virence or contact of the disease of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This probe, along with AATISI60, binds to part of a 50-kb region between sequence-tagged sites 54F and 5BS on chromosome-9p21, between a methylthoadenosine-phosphorylase gene (AATISI67) and an interferon-alpha gene cluster, and may be used to isolate a cyclin-dependent protein-kinase-4-inhibitor (CDK4I) tumour suppressor gene. The CDK4I gene has been isolated as phage lambda clones 10B1-10 (AATISISS) and 10A1 (AATISIS7) in Escherichia coli. The gene and its product may be used in diagnosis of cancer, particularly melanoma (especially dysplastic nevus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Probe; human, CDK41, cyclin-dependent kinase-4-inhibitor, tumour suppressor; chromosome-9p21; sequence-tagged site; mutation; methylthioadenosine-phosphorylase; interferon-alpha; 54F; 5BS; deletion, leuksemia; melanoma; diagnostic; dysplastic nevus syndrome; glioma; non-small cell lung carcinoma; cancer; gene therapy; antisense; ribozyme; antibody; imaging; 88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cyclin dependent kinase inhibitor gene, related vectors and antibodies - useful for diagnosis, assessing predisposition and treatment of cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

MTS polypeptide-encoding cDNAs and mutants of these are useful for the diagnosis or prognosis of human cancer. Germ-line mutations of MTS cDNAs can be used for diagnosing predisposition to melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL and cancers of the pancreas, thyroid, ovary, uterus, testis, kidney, stomach and rectum. The wild cype gene is useful for gene therapy and MTS polypeptides may also be used for protein replacement therapy. Also the polypeptides or cells contg, an altered MTS gene are
               may also be used in cancer gene therapy, or in antitumour antisense oligonuclectide or ribozyme construction. Antibodies against CDK41 may be

Nucleic acids based on multiple tumour suppressor, MTS, sequences - useful as hybridisation probes, primers and recombinant production of MTS in the diagnosis and treatment of cancers related to MTS mutation(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is the nucleotide sequence of a nucleic acid used in the method of the invention involving the used of the multiple tumour suppressor (MTS) gene, to diagnose and treat cancer. The MTS gene is useful in the diagnosis and prognosis of human cancer, e.g. by standard nucleic hybridisation techniques, of patient samples. The mutated sequences are those that are present in somatic mutations of the gene in cancers. The weetors can be used for gene therapy strategies to replace function of mutated protein in patients. These can also be used to construct protein mimetics, also for therapeutic strategies. In addition the expression constructs can also be used for recombinant production of MTS.

Recombinant MTS can be used for recombinant production of MTS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MTS1; multiple tumour suppressor; diagnosis; cancer; germ-line mutation;

PCR primers AAV70587-93 were used to screen exons in human multiple tumour suppressor 1 (MTS1) gene for germline mutations. The MTS1 sequence is homologous to the corresponding murine gene. Primers designed from the gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, uncrens and kidneys. (Updated on 20-MAR-2003 to correct PF field.)
                               Mouse multiple tumour suppressor gene segment – useful for primer design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the isolation of the gene encoding the human multiple tumour suppressor 1 (MTS1) (AAA95633). The MTS1 protein has a cytostatic activity and is used in protein replacement therapy. This sequence is a PCK primer used in the amplification and detection of mutations in the MTS1 gene. MTS1 is useful in disgnosing human cancers such as (ocular) melanoma, leukemia, astrocytoma, glioblastoma, lymphoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel protein composition useful in protein replacement therapy for diagnosing and treating cancer comprises a specific weight percent of human multiple tumor suppressor 1 polypeptide.
                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; human; multiple tumour suppressor 1; MTS1; diagnostic; cancer; gene therapy; protein replacement therapy; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                     This invention describes three human multiple tumour suppression proteins. The MTS gene locus is also referred to as the familial melanoma (MLM) gene locus, located on human chromosome 9p21. Germ line mutations in MTS genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum. NOTE: This sequence is not mentioned in the specification but is given in the sequence ID listing. (Updated on 17-OCT-2003 to standardise OS field)

This sequence is a PCR primer for DNA encoding the human MTS1 protein. The invention relates to a method for diagnosing a polymorphism associated with a predisposition to cancer by detecting a germ-line alteration of a wild-type Multiple Tumour Suppressor (MTS) gene or its expression products in a human sample. The method comprises detecting a germ-line alteration of a wild-type MTS gene or its expression products one of the cancers. The cancer is selected from melanoma, leukaemia, one of the cancers. The cancer is selected from melanoma, leukaemia, lymphocytic leukaemia, lymphoma, glioma, Hodgkin's lymphoma, chronic lymphocytic leukaemia, leasties, kidney, stomach and rectum. The method may be used as the basis for developing very important diagnostic tests capable of predicting the predisposition to cancers. The MTS gene is
                                                                                                                                                                                 ö

The piregular uncertainty of the human MTSIE1-beta. (I) is useful for polynucleotide sequence of the human MTSIE1-beta. (I) is useful for introducing will-drype MTS function to a cancerous or pre-cancerous cell which carries diminished or mutant MTS alleles for suppressing neoplastic which carries diminished or mutant MTS alleles for suppressing neoplastic growth of the recipient cells. (I) is also useful for increasing the level of expression of MTS gene even in tumour cells in which the mutant gene is expression of MTS gene even in tumour cells in which the mutant central and a moral level but the gene product is not fully functional. A host cell transformed with (I) is useful as a model system to study cancer remission and drug treatment which promotes such remission. The present invention relates to somatic mutations and germ clime mutations in the MTS gene and their use in the diagnosis and prognosis of human cancer e.g. melanoma, leukaemia, and cancers of the prognosis of human, glioma, Hodgkin's lymphoma, and cancers of the pancers, byroid, ovary, uterus, testis, kidney, stomach and rectum. The present sequence represents an oligonucleotide given in the sequence listing from the present invention, but which does not appear to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New vector useful for gene therapy of cancer associated with mutation in tumor suppressor gene, comprises DNA sequence of multiple tumor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a vector (I) comprising an isolated DNA
                                                                                                                                                                                         Human, multiple tumour suppressor, MTS, somatic mutation, cancer, diagnosis, germ line mutation, gene therapy, cytostatic, melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match 0.3%; Score 15.8; DB 1; Length 20; Best Local Similarity 89.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to variants (AAA11196-A11206) of the human multiple tumour suppressor 1 (MTS1) gene (AAA11165). The variants have the following changes relative to the wild type coding sequence: A at any of positions 265, 442, 330 and 329; T at any of positions 172, 238, 341 and 148 and deletions of nucleotides 290-294, 172-179 or 126-129. The variants are somatic mutations of MST1, indicative of predisposition to melanoma and many other cancers, so detecting them is useful for aniayasis, prognosis and monitoring of cancer (including prenatal analysis). Cells and animals that express the variants are useful as model systems for identifying potential anticancer agents. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gape

The invention relates to canine interleukin-4 (IL-4), canine or feline CC FiL-3 ligand, canine or feline CD40, canine or feline CD54 (CD40 ilgand), canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony-stimulating factor (CMCSF), and modelocides which encode these immunoregulatory proteins. The proteins, consed as vaccined nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly acts, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including consequences and legises, tumnours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while concluding response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while concluding as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).

The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection, and in drug cargetting. Sequences AAZ55491.4255498, AAZ55515 and AAZ555181-

C ES5608 represent PCR primers used in isolation, amplification and cloning of CDNAs encoding the immunoregulatory proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid sequencing; single-stranded nucleic acid binding protein;

The present invention relates to a method for identifying a target base in a nucleic acid ("template"). A primer is used in the present method, which hybridises to the template adjacent to the target position. A polymerase reaction is then carried out on the primer and template in the presence of a nucleotide, which is incorporated and detected only when the nucleotide is complementary to the base in the target position. A single-stranded nucleic acid binding procein (SSB) is included in the polymerase reaction step. The present sequence is an oligonucleotide product, produced by the present method. This sequence was used to exemplify the advantages of the new method of the present invention. The method is useful for sequencing nucleic acids such as DNA and for identifying single nucleotide mutations which are characteristic of many
                                                                                                                                                                                                                                                                                                      Identifying a target base in a nucleic acid comprising polymerase reaction of a target sequence with a primer where a single single-grranded nucleic acid binding protein is included in the reaction, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human antibody; detection; Fab; immunoglobulin; heterophilic antibody;

                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                  the present invention describes a method for detecting an analyte in a human sample containing human antibodies that specifically bind to antibodies from a nonhuman species. The method involves contacting the sample with a human antibody (I) which specifically binds to antibodies from a nonhuman species and detecting the binding between (I) and the analyte to indicate presence of the analyte. The method is used for detecting an analyte in a human sample containing human anti-mouse antibody (HAMA) (preferably human anti-mouse idiotype antibodies and/or heterophilic antibodies). The method can also be used for detecting any type of targer antigon including bacterial, fungal and viral pathogens that cause human diseases e.g., hepatitis (A,B and C), influenza, Herpes, Glardia, Malaria, Leishmania, Staphylococcus aureus, Pseudomonas than antibodies can be used as detection reagents for performing clinical diagnostic tests and for performing other in viro detection assays, including for research purposes. (I) can be used in qualitative assays designed to indicate the presence of one or more target antigens above minimally detectable amounts of the sample that usually correspond to the sensitivity limitations of the sample that usually correspond to the sensitivity limitations of the sample that usually correspond to the sensitivity limitative sense. Observed out using (I): AAH41686, and AAB993361 to AAB99339, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                             Detecting analyte in human sample containing human antibodies binding to nonhuman-antibodies, involves contacting sample with human antibody which binds to antibodies from nonhuman species and detecting binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The sequence represents PCR primer #3 used in analysis of multiple tumour usupressor MTS1 and MTS2. The MTS genes, and expression products, are useful for treating, diagnosing or prognosing human cancer. In particular, the MTS gene is useful for diagnosing a predisposition to or as a gene therapy for melanoma, leukaemia, astrocytoma, gliobastoma, lymphoma, chronic lymphatic leukaemia (CLL), or cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach or rectum. The gene may be used in both cancerous and pre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method (M1) for producing a human antibody phage display library (1), comprising: (1) providing a nonhuman transgenic animal (II) whose genome comprises human immunoglobulin genes; (2) isolating nucleic acids encoding human antibody chains (III) from lymphatic cells; and (3) forming a library of display packages whose members comprise a nucleic acid encoding (III) which is displayed from the package. The method is used for producing a human antibody display library, e.g., a Fab phage display library. The display method may be used to screen nucleic acids encoding antibody chains obtained from immunised nonhuman transgenic animals, and from this a population of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Producing a human antibody phage display library comprises providing a transgenic animal whose genome comprises human immunoglobulin genes and isolating nucleic acids encoding antibody chains from lymphatic cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, antibody, immunoglobulin, interleukin 8; IL8; immunogen; human antibody phage display library; immunisation; transgenic animal;

                 display library using this method means there is no need to immunise humans with antigens, and the difficulties faced with immortalising B cells are avoided. AAH29958 to AAH30066 and AAB74994 to AAB75056 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to somatic and germ line mutations in the multiple tumour suppressor (MTS) gene in human cancer. The invention also relates to therapy of human cancer which have a mutation in the MTS gene, including gene therapy, protein replacement therapy, and procein mimetics. The MTS sequences are useful for diagnosing predisposition to muman cancer or for diagnosing and prognosing predisposition to melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL and cancers of pancreas, breast, thyroid, ovary, uterus, testis kidney, stomach and rectum. They are also used for screening drugs for cancer treatment. The present sequence is 42F primer used for amplifying human MTS1 exon 2 sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention

New multiple tumor suppressor 2-specific antibodies useful for detecting differences in the absence of the peptides or mutant gene products, or
                                                                                                                                     The present invention relates to an antibody or its fragment that specifically binds to a human multiple tumour suppressor (MTS). The invention is useful for detecting differences in the absence of MTS peptides, to screen a tissue or to detect mutant MTS gene products. The antibodies will immunoprecipitate MTS proteins from solution as wall as react with MTS protein on Western or immunoblots of polyacrylamide gels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New method of preparing mammary gland bioreactor with macrofragment DNA for implementing site-specific and fixed time expression of target genes in mammary glands and producing transgenic animals.
                                                                                                                                                                                                                                           of
                                                                                                                                                                                   The invention relates to a method for the diagnosis of cataract susceptibility in an individual. The method comprises detecting variat: in the crygs gene, its transcript and/or protein of the individual by comparing with the normal gene to indicate the higher possibility in suffering from cataract. The crygs gene and gene-encoded protein are useful in the diagnosis and in pharmaceutical compositions for the treatment of a lesion of a crystalline lens, particularly for therapy cataract. This polynucleotide sequence represents an oligonucleotide related to the crygs gene of the invention
                                                                                                                                                                                                                                                                                                                    Gaps

The present invention relates to antisense compounds and methods for modulating the expression of human phosphorylase kinase beta. The antisense compounds, particularly antisense oligonucleotides, target and inhibit the expression of human phosphorylase kinase beta. The antisense compounds are useful for inhibiting the expression of human phosphorylase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "OTHER= Phosphorothicate internuclectide linkages, optionally bases 1-5 and 16-20 are 2'-methoxyethoxy (2'-MOE) bases, where the 2'-MOE cytidines are also
                                                bioreactor using a large fragment of DNA, comprising a mammary gland bioreactor using a large fragment of DNA, comprising injecting the DNA macrofragment into a fertilised ovum and transferring the ovum into a goat, where the target gene in the macrofragment has site-specific expression in the mammary gland of the goat. The method is useful for effectively implementing site-specific and fixed time expression of target genes in mammary glands and producing transgenic animals e.g. goats. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antisense oligonucleotide which inhibits expression of phosphorylase kinase beta, useful for treating metabolic disorder e.g. diabetes, prevent or delay infection, inflammation or tumor formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; phosphorylase kinase beta; metabolic disorder; diabetes;

        condition associated with expression of phosphorylase kinase beta such as metabolic disorder e.g. diabetes. The compounds are useful for to prevent or delay infection, inflammation or tumour formation. The antisense compounds are useful in the preparation of a pharmaceutically formulation. They are highly specific, have an enhanced affinity for the nucleic acid target, and are safely and effectively administered to humans. ABK68888-ABK69955 represent human phosphorylase kinase beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  or mouse tumor associated with
                                                                                                                                  antisense oligonucleotides which comprise a phosphorothioate backbone
                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                       Tumour necrosis factor receptor 2; TWFR2; antisense oligonucleotide;
phosphorothioate; 2'-O-methoxyethyl; ss.
 kinase beta in human cells or tissues and for treating an animal

The humanized antibodies comprise heavy and light chains, which have sequences of mouse origin at the heavy and light Complementarity Determining Regions (CDR) 1-3 (HCDR), HCDR2, HCDR3, LCDR1, LCDR2 and LCDR3). In addition, human anti-mouse antibody (HAMA) response is minimized by eliminating peptide sequences from heavy chain of the above humanized antibody which bind Major Histocompatibility complex (MHC) class II molecules. The antibodies are useful in preventing and/or treating hepatitis B virus infection in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
to a nucleic acid encoding human or mouse tumour necrosis factor receptor 2 (TNRE2). Also described is a method for inhibiting expression of human or mouse TNRR2 comprising contacting cells or tissues in vitro with one of the claimed compounds. The antisense compounds are used to treat a disease or condition associated with expression of TNRR2. The present sequence represents a mouse TNRR2 antisense chimeric phosphorothioate oligonucleotide, which is given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New humanized heavy or light chain antibody that specifically binds to the surface antigen S of hepatitis B virus (HBV), useful for preventing
                                                                                                                                                                                                                                Gape

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to humanized antibodies against the surface antigen S of hepatitis B virus (HBV). The humanized antibodies comprise heavy and light chains, which have sequences of mouse origin at the heavy and light Complementarity Determining Regions (CDR) 1-3 (HCDR1, HCDR2, HCDR3, LCDR1, LCDR2 and LCDR3). In addition, human anti-mouse antibody (HRMA) response is minimized by eliminating peptide sequences from heavy chain of the above humanized antibody which bind Major Histocompatibility Complex (MHC) class II molecules. The antibodies are useful in preventing and/or treating hepatitis B virus infection in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                      New humanized heavy or light chain antibody that specifically binds to the surface antigen S of hepatitis B virus (HBV), useful for preventing and/or treating HBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to a DNA construct for expressing in insect cells, a complete antibody light or heavy chain derived from the corresponding of a complete antibody light chain derived from the corresponding single chain Fv. For a vector for expression of a light chain (including one from a single chain Fv For a vector for expression of a light chain (including one from a single chain Fv For a vector for a expression of secretion of a protein from insect cells, and a DNA sequence encoding the leavy chain of the desired antibody. For a vector for a expression of heavy chain, the cassette includes the same signal sequence encoding the heavy chain of the desired antibody, and the coding construct also contains a promoter and a transcription terminator. Also construct also contains a promoter and a transcription terminator. Also included are the transformed insect cell expressing a desired antibody, and an Igd1 antibody derived from the expression in an insect cell of the construct, a passive vaccine against an infections agent recognised by the Igg1 antibody (comparising the Igg1 antibody from a corresponding for the Igg1 antibody from a corresponding stellar producing a complete chimaeric light chain gene of single chain Fv fragment. preducing a complete chimaeric light chain and transforming the insect cells with the construct to isolate the Igg1 antibody is also useful for treating an infection caused by an agent recognised by the Igg1 antibody is also useful for detecting antigens specific for the infection suced by an agent recognised by the Igg1 antibody is also useful for antibodies in a sample suspected of containing such antigens, and for passive immunisation, especially in humans, without negative immunisation, especially in humans, without negative immunisation is such as serum sickness or anaphylactic special by persent construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel DNA construct for obtaining conformationally active immunoglobulin GI antibody from Fab fragment, has an antibody light or heavy chain derived from Fab fragment or a light chain derived from single chain Fv.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     prence is a synthetic linker portion of a PCR primer preceded by part

                                                                                                                                                                                                                                                                                                                                                                                                                                A new compound, which is 8-50 nucleobases in length targeted to a nucleic acid molecule encoding urokinase plasminogen activator, specifically hybridises with and inhibite the expression of urokinase plasminogen activator. The compound is useful for preparing a composition for treating (e.g. by gene therapy) hyperproliferative disorder, cancer e.g., breast, colon, bone, brain, ovary, cervix, endometrium, stomach or kidney cancer, or tumour metastasis. This sequence represents an anitsense oligonucleotide used to modulate expression of urokinase plasminogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR; primer; 88; neoplastic; pre-neoplastic; heterozygosity; cytostatic; urothelial neoplasia; MTS1; human.

The invention relates to a novel method for detecting a cell with a neoplastic or pre-neoplastic phenotype, comprising testing a sample cell for the presence of loss of heteroxygosity at one or more loci on one or more chromosomes. The chromosomes are selected from a group of chromosome indicative of a neoplastic or pre-neoplastic phenotype. The method of the invention has cytostatic activity. Detecting a cell with a neoplastic or pre-neoplastic phenotype is useful for diagnosing, monitoring or treating pre-neoplastic phenotype is useful for diagnosing, monitoring or treating urchhelial neoplasia. The pregresent sequence represents a PCR primer used in the invention to amplify exon 1 of the MTS1 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting a cell with a neoplastic or pre-neoplastic phenotype, useful for diagnosing or treating neoplasia or pre-neoplastic conditions, comprises testing the cell for the presence of loss of heterozygosity at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /mod_base= OTHER
/note= "This oligonucleotide has a phosphorothioate
backbone and 2-"methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 5 nucleotides in length. Also all
cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vitamin D nuclear receptor antisense oligonucleotide, SEQ ID 39.

                                                                                                                                                                       The present invention relates to novel antisense oligonucleotides (ADB99875-ADB99952) which are targeted to a human vitamin D nuclear receptor coding sequence (ADB99864), and specifically hybridizes with and inhibits the expression of vitamin D nuclear receptor. The antisense oligonucleotides are useful for treating an animal having a disease or condition associated with vitamin D nuclear receptor, e.g. cancer or developmental disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to novel tumour suppressor genes, termed as

The present invention relates to a method of identifying a predisposition to melanoma. The method comprises determining whether a human individual carrying a cyclin dependent kinase inhibitor 2A (DKNA2A) mutant allele also carries a melanocortin-1 receptor (MCIR) variant allele, where the presence of a WCIR variant allele indicates a predisposition of the individual to melanoma greater than that expected as a consequence of the CDKN2A mutant allele alone. Also disclosed is a kit for identifying a predisposition to melanoma. The kit comprises MCIR gene-specific primers and/or CDKN2A gene-specific primers and MCIR variant allele-specific primers probes and/or CDKN2A mutant allele-specific
                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying a predisposition to melanoma comprises determining whether an individual carrying a cyclin dependent kinase inhibitor 2A (CDKN2A) mutant allele also carries a melanocortin-1 receptor (MCIR) variant
proteins. The polynucleotides are useful for preparing a composition for diagnosing or treating cancer. Sequences of the invention are also useful in gene therapy. The present sequence is human CDK41' exon DNA specific primer used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Predisposition; melanoma; human; cyclin dependent kinase inhibitor 2A; CDKW2A; mutant allele; melanocortin-1 receptor; MCIR; variant allele; gene-specific; primer; 85.
                                                                                                                                                                                                                                                                  Gaps

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding reggion, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genee encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an initial numarcory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatch, hypotenaive, immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antialfammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of tung surfactant in a subject's tissue, or treating bronchoconstriction,
                                                                                                                                                                                                                                                                                                                  ö
